## Pro-Med™ OEM power cord

The SafetyGate Pro-Med™ is a simple, effective and low cost cord-mounted restart protection solution for ME OEM applications. The miniaturized SafetyGate circuitry resides in the cable between your device and power plug providing restart protection not only after a power outage or breaker trip, but from an accidental un-plugging at the supply outlet as well.

SafetyGate products are the only restart protection solutions that use a tool or machine's own power switch to reset; assuring a connected device does not receive power unless the user is in the operating position. This patented feature prevents dangerous "secondary restart" hazards caused when resets are made away from the tool or machine.

The SafetyGate Pro-Med™ is designed to OEM specifications as approved by UL/CSA/IEC 60730 and UL 817; allowing the ME manufacturer to meet the latest IEC restart protection standards without modifications to their product other than a power cord replacement. Available in custom lengths and NEMA green dot plug configurations.

## Commercial-Med™ OEM Restart Protection Solution

\*IEC 60601-1 v.3 standard for OEM Restart Protection

11.8 Interruption of the power supply / SUPPLY MAINS TO ME EQUIPMENT

ME EQUIPMENT shall be so designed that an interruption and restoration of the power supply shall not result in a HAZARDOUS SITUATION other than interruption of its intended function.

NOTE - This can require testing at several durations and ME EQUIPMENT states.

Compliance is checked by interruption and restoration of relevant power supplies.
